BioNatural Healing College (BNHC)

Questions Version I

BioNatural Plant Disease Management (Pest Management)

Complete the Questions with the Correct Answers

Name: ----- DPR License/Certificate-----

| Topic 1: Understanding Plant Disease Concepts | |
|--|---|
| What | causes plant diseases? |
| 1. | The disease of plants is a like a disease of humans and animals. |
| A. | Complex phenomena |
| | Simple process |
| C. | Active process |
| | None of the above |
| To K | now Terminology from Plant Pathology |
| | is an organism which causes a disease. |
| | A. a pathogen |
| | B. a plant |
| | C. an insect |
| | D. None of the above |
| 3. | are parasites that typically kill and obtain energy from dead host cells |
| | A. Necrotrophs |
| | B. Biotrophs |
| | C. Symptoms |
| | D. None of the above |
| 4. | Rust is a type of disease caused by a specific group of fungi, often producing orange-red |
| | "rust" colored spores. True or False |
| Th | ne pathogen |
| 5. | The second factor in the plant disease triangle is the pathogen. |
| | True or False |
| | Types of plant pathogens |
| 6. | Biotrophs attack healthy host tissues at any stage. True or False |
| Fu | ıngi |
| 7. | Most often plant diseases are caused by fungi. True or False |
| Di | seases caused by fungi |
| 8. | Fungi are unable make their own food, therefore, in the process of obtaining food from |
| | higher plants, fungi injure roots, stems, leaves, and fruit. |
| | True or False |
| He | ow do fungi reproduce? |
| 9. | Spores are reproducing by fungi, they exist in different forms such as sclerotia and |
| | mycelial fragments. True or False |
| | |

| Fungi spore's penetration and plant tissue | |
|---|----------|
| | |
| 10. Spores must germinate and penetrate in the availability of moisture in order for an infection to occur. True or False | |
| Direct penetration | |
| • | 1 |
| 11. A germ tube formation is involved in direct penetration by using enzymes and physical pressure. True or False | 1 |
| Factor necessary for infection | |
| Moisture | |
| 12. Availability of moisture on the plant surface is one of the crucially important factors for | ır |
| most fungus spores to germinate and penetrate plant tissue. | ′1 |
| True or False | |
| Bacteria | |
| 13. Bacteria are tiny single-celled organisms, much smaller than fungal spores. | |
| True or False | |
| How are bacteria spread? Blowing rain | |
| 14. Bacteria ooze (exudate seen coming out of water-soaked lesions) out of infected tissue | <u>.</u> |
| and form a mass of sticky material on the plant surface due to pathogenic bacteria. | |
| 15. True or False | |
| Viruses | |
| 16. Viruses have the ability to replicate within the host cells, and cause disease, in most | |
| cases. | |
| True or False | |
| Diseases caused by viruses | |
| 17. Viruses are spreading by various methods depending on virus groups for instance, by | |
| insects (aphids, whiteflies), soil (nematodes, soil fungi), and direct contact and cultivat | ion |
| activities. True or False | |
| Nematodes | |
| 18. Plant-pathogenic nematodes are non-segmented roundworms, they begin the life cycle | |
| from the eggs and progress through four juvenile stages until they become adults capab | ole |
| of reproduction. True or False | |
| How do nematodes feed? | |
| 19. The nematode inserts this spear or stylet into the root tissue, injects a chemical substant | |
| and then withdraws nutrients as it feeds. True or False or False | - |
| How does a pathogen invade? | |
| 20. First an aggressive attack and compatible response is an interaction that results in disea | ıse. |
| True or False | |
| The plant immune system | |
| 21. Plant-pathogen interactions can be considered as a two-way communication process in | |
| which not only the plant is able to recognize a foreign organism and defend itself from | it, |
| but the pathogen must also be able to manipulate the biology of the plant. | |
| True or False | |
| Chemical weapons of pathogens | |
| 22. The enzymes include lipases and cutinizes for breaching the wax and cuticle of aerial | |
| parts of the plant. True or False | |

True----- or False----Powdery Mildew

27. Initial symptoms of powdery mildew appear on leaves as chlorotic spots on the upper leaf surface. True------ or False------

Disease Management: Option for Organically Powdery Mildew

distribute the pathogen within the main growing season of the crop.

28. Organic grape growers dedicated to disease management include Sulfur, Serenade Max, Sonata, M-Pede, Organic JMS Oil, and Purespray Green horticultural oil (are acceptable on organically certified grapes). True------ or False------

Biologicals powdery mildew management

29. *Bacillus pumilis* (Sonata) is a microbial, (44) it can be used at the rate of 2-4 qt per acre with the 4 hours restricted entry interval (R.E.I) and zero (0) preharvest intervals (P.H.I.). True------ or False------

Fungicidal powdery mildew management

Soilborne pathogens

30. Worldwide soilborne diseases are the cause of damage to various crops including pre and post-emergence such as Damping-off, Fusarium, Pythium, Rhizoctonia, Phytophthora, Verticillium wilt and nematodes. True------ or False------

Damping-off disease

31. A wide range of soilborne pathogens include *Phytophthora spp*, *Pythium spp*, (oomycetes) Fusarium spp, Rhizoctonia spp (are responsible for the development of damping-off disease). True------ or False-------

Rhizoctonia root and stem rot on soybean

Rhizoctonia solani is a soilborne fungus, the most common strains that infect soybean are AG-2-2 and AG-4 (Different AG groups can have different optimal conditions for growth and infection). True----- or False------ or False------

White mold (Sclerotinia)

32. Sclerotinia sclerotiorum, S. minor, and S. trifoliorum (Several other Sclerotinia species cause diseases other than white mold. The pathogen that causes dollar spot of turf

| | Lanzia or Moellerodiscus). True or False |
|-------------------------------------|---|
| | Sudden Oak Death |
| 33. | The disease called "Sudden Oak Death" is the result of lethal stem cankers in the inner |
| | bark that expand and girdle the stem, killing the tree. Examples: symptoms of certain oak |
| | family trees. True or False |
| | Grown gall |
| 34. | Gall may occur on roots, stems, even leaves. Therefore, tissue has disorganized growth |
| | with an enlarged cambium layer and irregular vascular tissue. |
| | Trueor False |
| | Tree diseases notes: Bacterial leaf scorch |
| 35. | Xylella fastidosa is a bacterium that grows inside the plant's vascular tissue where it blocks |
| | water transport abilities of the plant from roots. Trueor False |
| | Management |
| 36. | Many cultural practices can prevent and reduce the incident of disease. Chemical controls |
| | are not effective option. True or False |
| | Herbaceous Plants and their diseases |
| 37. | African daisy (Gerbera) Pythium, root rot. True or False |
| 38. | Pansy (Viola) - anthracnose, black root rot, Botrytis blight, Cercospora leaf spot, |
| | Phytophthora root/crown rot, Pythium root/crown rot. |
| 39. | Trueor False |
| T | opic 2: BioNatural Plant Disease Management (BNPDM) |
| 4.0 | |
| 40. | |
| | BNPDM is ecologically and environmentally friendly approaches to the management of |
| | plant diseases; particularly here in this section, soilborne pathogens are the focus of |
| | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. |
| | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True or False |
| 41 | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True or False Exclusion |
| 41. | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True or False Exclusion Local law or quarantine by region, state, country, or international that prevents the |
| 41. | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True or False Exclusion Local law or quarantine by region, state, country, or international that prevents the movement of disease-causing agent. True or False |
| | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True or False Exclusion Local law or quarantine by region, state, country, or international that prevents the movement of disease-causing agent. True or False Smart cropping system Crop rotation, mixed cropping, intercropping are useful techniques that are widely applied |
| | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| 42. | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| 42. | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| 42. | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| <i>42. 43.</i> | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| <i>42. 43.</i> | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| <i>42. 43.</i> | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| <i>42. 43.</i> | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| <i>42</i> . <i>43</i> . | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |
| <i>42</i> . <i>43</i> . <i>44</i> . | plant diseases; particularly here in this section, soilborne pathogens are the focus of consideration due to inadequate control and use of chemicals fungicides. True |

amendments such as rice bran, fresh crop residues, and soybean flour.

historically has been called Sclerotinia homoeocarpa, but is likely to be reclassified as

| | True or False |
|-----|---|
| | Soil amendments |
| 46. | BioNatural healing in the form organic amendments to the soil is used for improving soil |
| | health and crop productivity as well as suppressing soilborne plant pathogens. |
| | Trueor False |
| | Soil health and plant nutrition |
| 47. | Soil health covers soil pH, nitrogen, phosphorus, potassium, calcium, zinc levels and other |
| | nutrients which can play an important role in the management of soilborne plant pathogens |
| | Trueor False |
| | Why is important mineral nutrition in the suppression plant diseases |
| 48. | Sustaining plant health, along with suppressing plant diseases depends on proper supply or |
| | nutrition which is one of the important components of BioNatural Pest Management. |
| | True or False |
| 49. | The primary macronutrients include nitrogen (N), phosphorous (P), and potassium (K). |
| | True or False |
| | How nutrients play role in reducing plant disease severity? |
| | Nitrogen (N) and plant disease |
| 50. | Studies have shown that when a disease is caused by the facultative parasites like Fusarium |
| | oxysporum, Alternaria solani and Xanthomonas sp high N supply decreases the severity of |
| | the infection. True or False |
| | Potassium (K) and plant disease |
| 51. | In potatoes, potassium application was found to decrease the incidence of several diseases |
| | for instance, late blight (Phytophthora infestans), dry rot (Fusarium sp), powdery scale |
| | (Spongospora subterranean), and early blight (Alternaria solani). |
| | Trueor False |
| | Magnesium (Mg) and plant disease |
| 52. | Mg fertilization plants in reducing the disease severity for example, rice, wheat citrus, |
| | potato, poppy, and peanut. True or False |
| 53. | Iron (Fe) plays a major role as a micronutrient in the controlling of plant disease and |
| | improving plant health such as in energy transfer, as an activator for enzymes that control |
| | respiration, for chlorophyll formation, for chloroplast, and enzyme component. |
| | True or False |
| | Association of plant immunity and plant pathogens |
| 54. | Plants have a unique system of defense if compared to the human body's immune system |
| | plants have evolved with a stunning structural, chemical, and protein-based defenses |
| | designed to detect invading organisms and stop them before they are able to cause |
| | extensive damage. True or False |
| | Understanding of plant-microbe interactions and plant disease formation |
| 55. | The healthy plants with their constitutive mechanism as physical barriers display an |
| | excellent ecosystem for microorganisms, because the spectrum of interactions among the |
| | microbes comprise of both mutualistic and pathogenic. |
| | True or False |
| | Disease conditions for host, pathogen, and environment |
| 56. | A plant disease is the condition that occurs between a susceptible plant described as a |
| | compatible host which is infected by an aggressive pathogen under the favorable |
| | environmental conditions that favor disease. |

| | Trueor False |
|-----|---|
| | Role of recognition factors in plant diseases |
| 57. | Without the proper recognition, factors such as surface cells between pathogen and |
| | plants species or varieties may not be infected. |
| | Trueor False |
| | Host receptors and sites for toxins |
| 58 | After all the compatibility between host receptors and pathogens, only the plants that have |
| | sensitive sites are susceptible to become diseased. |
| | True or False |
| | Case study pathogens overcome plant defense mechanisms |
| 59 | If a pathogen is capable of suppressing basal defense, plants may respond with another |
| | line of defense it is called hypersensitive response (HR). |
| | True |
| | Apple scab (Fungus disease) |
| 60. | Spring is the season with the first visible symptoms of apple scab such as pale, water- |
| | soaked spots the size of a pinhead on the new leaves. |
| | Trueor False |
| | Anthracnose of turfgrass |
| 61. | The fungus Colletotrichum cereale overwinter as mycelium or conidia associated with |
| | previously infected plant tissue and survive as darkly pigmented aggregates of hyphal |
| | cells (stromata), that are formed on stolons and at the base of tillers. |
| | True or False |
| | Citrus Greening (Huanglongbing) |
| 62. | There are three species such as Africa Candidatus Liberibacter africanus (LAF), Asia |
| | Candidatus Liberibacter asiaticus (LAS) and Candidatus Liberibacter americanus |
| | (LAM). Trueor False |
| | Leaf scorch |
| 63. | Symptoms of this disease are often confused with those caused by drought. Leaves on one |
| | or more branches may yellow and begin to droop; soon the margins of the leaves turn a |
| | deeper yellow or brown, and the leaves eventually die. |
| | True or False |
| | Tomato spotted wilt |
| 64. | The tospoviruses are transmitted by thrips (<i>Thysanoptera</i> : <i>Thripidae</i>) and replicate in both |
| | the thrips vectors and the plant hosts. |
| | True or False |
| | Phytochemical defenses against fungal pathogens |
| 65. | The phytochemicals also induce structural modifications of the hypha and mycelia thus |
| | inhibiting production of substances such as aflatoxin and fumonisin from some of fungi |
| | such as Aspergillus spp and Fusarium spp., respectively. |
| | Trueor False |
| _ | Phytochemicals defenses against bacteria pathogens |
| 66. | Gram-negative bacteria are more susceptible than gram-positive bacteria due to the absence |
| | of a peptidoglycan cell wall. True or False |
| | Phytochemicals defenses against nematode pathogens |
| | |

| 67. | The activity of Melia azedarach (commonly known by many names such as chinaberry |
|-----|--|
| | tree, Persian lilac, Pride of India, bead-tree, Cape lilac, syringa berry-tree), against |
| | Meloidogyne sp (Root-knot nematode). Trueor False |
| | Organic disease control |
| 68. | Organic farming (OF) can be defined as an ecologically, economically and socially |
| | responsible way of farming, providing an enduring supply of safe and healthy food and |
| | fibers, with least possible losses of nutrients and energy and the least negative impacts on |
| | the environment. Trueor False |
| | Limiting pathogen entry by minimizing initial inoculum |
| 69. | The use of healthy clean seeds or vegetative propagating materials, crop rotation, spatial |
| | isolation and removal of certain weeds. True or False |
| | Pathogen control with curative methods in OF |
| 70. | Copper fungicides are considered mined natural products and are allowed for use against |
| | bacterial and fungal diseases, however, in some parts of the world where it is restricted, |
| | use of copper fungicides are increasing. Trueor False |
| 71 | Classification of fungicides |
| /1. | In general concepts, fungicide is classified as protective or systemic. Protective |
| | fungicides with its mode of action are usually effective against a wide range of fungi. |
| | Trueor False |
| 72 | Systemic fungicides This type of fungicide is absorbed by the plant and transported to the site of infection. |
| 12. | Trueor False |
| | Benefits of useful rules for fungicide application |
| 73 | Once a disease has started, it would be difficult to eradicate it, however, many fungicides |
| 13. | have systemic modes of action, but it will not completely eradicate after diseases have |
| | started. Trueor False |
| | Why are alternative fungicides needed? |
| 74. | Fungicides should be maintaining a final plan of action as far as concerns for fungal |
| | disease management and the application of fungicides. |
| | Trueor False |
| | Actinovate AG |
| 75. | 0.0371% Streptomyces lydicus strain WYEC 108. Labeled for suppressing several foliar |
| | and soil-borne diseases on many crops; diseases and crops listed separately. |
| | Trueor False |
| | Let us consider a few examples of least-toxic fungicides for roses as a case |
| 76. | One of the distinctive characteristics of fungal spores and many fungal species germinate |
| | best under acidic conditions, however, baking soda solutions are significantly more |
| | alkaline. Trueor False |
| | Foundations of fungicide resistance |
| 77. | One of the reasons to know that resistance is a contributing factor in unsatisfactory |
| | fungicide application. Trueor False |
| | BioNatural Disease Management |
| /8. | Biopesticides which is a broad term, according to U.S. EPA biopesticides are derived |
| | from natural materials such as animals, plants, bacteria, and certain minerals. |
| | Trueor False |
| | Microbial secondary metabolites in plant disease management |
| | |

| 79. | The common beneficial microbial metabolites include Plant-Growth-Promoting Rhizobacteria (PGPR), and Plant Growth-Promoting Fungi (PGPF), normally residing in |
|-----|--|
| | rhizosphere on root surface or endophytes in the host plants. |
| | Trueor False |
| | |
| | Association of Plant-Growth-Promoting Rhizobacteria (PGPRs) and plant pathogens |
| 80 | Are beneficial free-living bacteria that colonize roots and promote growth health of plants |
| 00. | for instance, nitrogen fixation, phosphate solubilization, production of phytohormones |
| | and siderophores. Trueor False |
| | |
| 0.1 | Pseudomonas spp and plant disease The serve of Pseudomonas has the shility of calculating a suide spread of riches and |
| 81. | The genus of <i>Pseudomonas</i> has the ability of colonizing a wide-spread of niches and |
| | function as effective bio-control agent (BCAs) on <i>Fusarium</i> disease crops. |
| | Trueor False |
| 0.2 | Association Plant Growth-Promoting Fungi (PGPF) and plant pathogens |
| 82. | It is important to note that PGPF like PGPR play a significant role in controlling plant |
| | diseases caused by Fusarium spp. True or False or False |
| 0.0 | Association of Arbuscular mycorrhizae fungi (AMF) and plant disease |
| 83. | The AMF form beneficial symbiosis in most terrestrial ecosystems and crop production |
| | system. Trueor False |
| | Role of ISR (Induced Systemic Resistance) in plant |
| 84. | Both Induced systemic resistance (ISR) and Systemic acquired resistance (SAR) are two |
| | different phenomena but represent active plant defense responses in respect to plant |
| | pathogens attack. Trueor False |
| | Systemic Acquired Resistance (SAR) |
| 85. | SAR once induced remains active against broad range of pathogens for prolonged time and |
| | it not only resist pathogen attack but also cure disease if occurred. |
| | Trueor False |
| | Diagnosing plant diseases |
| 86. | Diagnosis is the process of determining the cause of plant disorder. |
| | Trueor False |
| | Components of diagnosis |
| 87. | The more accurate this information is and the better the sample submitted, the greater the |
| | opportunity for an accurate diagnosis by a laboratory diagnostician. |
| | Trueor False |
| | Observation |
| 88. | A good observer will develop a description of the symptoms and symptom development or |
| | progression, with specific and detailed as possible. |
| | Trueor False |
| | Sample collection |
| 89. | Plant samples collection is another significant part of diagnosis process in plant diseases |
| | management. Trueor False |
| | Confirmation of cause |
| 90. | first, after if the organism (s) is identified especially involved by the prevalent |
| | environmental conditions and known to cause disease on the plant infected. |
| | 4 |

| | Trueor False |
|-----|---|
| | Recommendation |
| 91. | Determine if the damage is sufficient and required for proper action. |
| | True or False |
